

Measured Li-free assay
Pressure history $b_c(q)$ (MPa)

In-window pressure input
 $p_c(q) = 2 \text{ MPa} + \eta b_c(q)$

Contact evolution + specified EIS readout

Measured charged-state spectrum
Fast resistance + spectral shape

Starting contact + readout template
Assumed $R_h = R_b + C/a$

The fitted response does not uniquely identify either physical contribution.
